Novel isolated, purified, or recombinant nucleic acid comprising polyketide modifying gene, there gene encodes polyketide modifying enzyme e.g., MegR, MegK, or MegM enzymes useful for producing modified polyketide.

Example 2; SEQ ID NO 1; 51pp; English.

The invention relates to a novel isolated, purified, or recombinant nucleic acid (I) comprising a polyketide modifying gene, where the gene encodes a polyketide modifying enzyme chosen from MegR, MegR, MegK, MegK, MegCV, MegCV, MegCV, MegBIII, MegL, and MegM enzymes. A method of the invention is useful for producing a modified polyketide, which involves culturing a recombinant cell comprising the recombinant nucleic acid

New nucleic acid sequences encoding enzymes involved in macrolide biosynthesis - useful for producing hybrid secondary metabolites, particularly erythromycin analogues.

Claim 8; Fig 3; 221pp; French.

This sequence represents the eryAI-eryK gene cluster from the Grampositive bacterium Saccharopolyspora erythraea which encodes enzymes involved in the production of the macrolide antibiotic erythromycin as a secondary metabolite. The erythromycin gene cluster spans approximately Sakb and contains at least 20 open reading frames (ORF). This sequence contains the eryBIV, eryBV, eryCVI, eryBVI, eryCVIV, eryCVV and eryBVII genes encoding ORFs 13, 14, 15, 16, 17, 18 and 19 respectively. A DNA representing the eryG-eryAIII region of the same cluster is shown in AAX25772. The genes are used to produce hybrid secondary metabolites in S.erythraea, i.e. erythromycin analogues which may have improved properties or as hybridisation probes for isolating homologous genes involved in glycosylation of macrolactones in macrolide-producing strains especifically oleandomycin-producing strains of Streptomyces antibioticus)
